CANARA ENGINEERING COLLEGE
Benjanapadavu, Mangalore –574219
DEPT.OF ARTIFICIAL INTELLIGENCE AND MACHINE
LEARNING

Department Vision

To be identified as learning centre in the domain of Artificial Intelligent and Machine Learning education that delivers competent and professional engineers to meet the needs of industry, society and the nation.

Department Mission

1. To impart skill-based (Artificial Intelligent and Machine Learning) education through competent teaching-learning process.
2. To establish a research and innovation ecosystem that provides solution for technological challenges of industry, society and the nation.
3. To set-up industry-institute interface for overall development of students through practical internship and team work activities.
4. To promote innovation and start-up culture among staff and students for addressing the challenges of needy.

Program Outcome

PO:1	Engineering knowledge: Apply the knowledge of mathematics, science, Engineering fundamentals, and an engineering specialization to the solution of complex engineering problems.
PO:2	Problem analysis: Identify, formulate, review research literature, and analyze complex engineering problems reaching substantiated conclusions using first principles of mathematics, natural sciences, and engineering sciences.
PO:3	Design/development of solutions: Design solutions for complex engineering problems and design system components or processes that meet the specified needs with appropriate consideration for the public health and safety, and the cultural, societal, and environmental considerations.
PO:4	Conduct investigations of complex problems: Use research-based knowledge and research methods including design of experiments, analysis and interpretation of data, and synthesis of the information to provide valid Conclusions.
PO:5	Modern tool usage: Create, select, and apply appropriate techniques, resources, and modern engineering and IT tools including prediction and modeling to complex engineering activities with an understanding of the limitations.
PO:6	The engineer and society: Apply reasoning informed by the contextual knowledge to assess societal, health, safety, legal and cultural issues and the consequent responsibilities relevant to the professional engineering practice.
PO:7	Environment and sustainability: Understand the impact of the professional engineering solutions in societal and environmental contexts, and demonstrate the knowledge of, and need for sustainable development.
PO:8	Ethics: Apply ethical principles and commit to professional ethics and responsibilities and norms of the engineering practice.
PO:9	Individual and team work: Function effectively as an individual, and as a member or leader in diverse teams, and in multidisciplinary settings.
PO:10	Communication: Communicate effectively on complex engineering activities with the engineering community and with society at large, such as, being able to comprehend and write effective reports and design documentation, make effective presentations, and give and receive clear instructions.
PO:11	Project management and finance: Demonstrate knowledge and understanding of the engineering and management principles and apply these to one's own work, as a member and leader in a team, to manage projects and in multidisciplinary environments.
PO:12	Life-long learning: Recognize the need for, and have the preparation and ability to engage in independent and life-long learning in the broadest context of technological change.

Program Educational Objectives

The graduates of BE-AIML program four years after graduation will

1. Design and develop learning-based intelligent systems in the field of artificial intelligent, machine learning, and allied engineering sectors.
2. Apply skills and knowledge of computer science to address relevant industry and societal problems or pursue higher education and research.
3. Graduates will design and deploy software that meets the needs of individuals and the industries.
4. Engage in lifelong learning, career advancement and adoption of changing professional and societal needs.

Program Specific Outcomes

1. Intelligent Systems: Select appropriate technologies to analyse, design, implement, and deployment of smart and intelligent systems.

2. Contemporary Systems: Design, and development of efficient IT solutions for challenging issues through experiential learning.

Course Objectives and Course Outcome

Database Laboratory with Mini-Project 21CSL55

Course Objectives

This course will enable the students to:

1. Foundation knowledge in database concepts, technology and practice to groom students into well-informed database application developers.
2. Strong practice in SQL programming through a variety of database problems.
3. Develop database applications using front-end tools and back-end DBMS.

Course Outcome

The student will be able to:

1. Apply the fundamental concepts of databases to construct ER diagrams and Relational schema.
2. Construct and manipulate the database using SQL.
3. Demonstrate the working of different concepts of DBMS
4. Apply the normalization techniques for development of database application for realistic problems.
5. Implement, analyze and evaluate the project developed for an application.

RULES RUBRICS 2023-24

DBMS LABORATORY WITH MINI PROJECT RULES

- 1) Bring completed lab record and student manual for every lab.
- 2) Show duly completed student manual and execution of experiments in the system .(PC) and get signature on student manual from the concerned staffs.

Parameters	Marks Allotted	Low	Medium	High
LABORATORY RUBRICS (30 MARKS)				
Viva Voce	8	Student did not answer any viva voce questions out of five	Student answered 4 to 5 viva voce question out of five	Student answered all the viva voce questions
		0	3-4	8
Record writing	10	Record was not submitted in the lab session	Record was submitted but incomplete or late submission	Completed record was submitted
		0	3-5	10
Conduction	8	Observation not written in the lab session	Observation was written but incomplete or late submission	Complete record was written and submitted in time
		0	3-5	6-8
Procedure	4	Procedure is not written	Procedure is not proper	Complete Procedure
		0	2	4
INTERNAL ASSESSMENT RUBRICS (2 IA TESTS EACH OF 50 MARKS SCALED DOWN TO 20MARKS)				
IA TEST 1				
Procedure write up	10	Procedure not written in IA Test	Incomplete procedure written	Correct procedure written
		0	5	10
Conduction	10	Conduction is not started	Partial Conduction	Complete Conduction
		0	5	10
Execution	10	Error display (No execution)	Partial execution	Complete execution
		0	5	10

Viva	20	Student did not answer any viva voce questions outof five	Student answered 4 to 5 viva voce question out of five	Student answered all the viva voce questions
		0	15	20
IA TEST2				
Procedure write up	10	Procedure not written in IA Test	Incomplete procedurewritten	Correct procedurewritten
		0	5	10
Conduction	10	Conduction is not started	Partial Conduction	Complete Conduction
		0	5	10
Execution	10	Error display (No execution)	Partial execution	Complete execution
		0	5	10
Mini Project Demo	20			
MINI PROJECT RUBRICS (20 MARKS)				
SYNOPSIS	4	Synopsis not submitted	Late submission	On date submission
		0	2	4
PRESENTATION	8	Average Presentation	Good Presentation	Excellent Presentation
		2	5	8
REPORT	8	Average Report	Good Report	Excellent Report
		2	5	8

DEPARTMENT OF INFORMATION SCIENCE AND ENGINEERING

DATABASE WITH MINIPROJECT LABORATORY 21CSL55

DBMS with Mini-Project Laboratory– 18CSL58

Syllabus

PART -A

1. Consider the following schema for a Library

Database: BOOK(Book_id, Title,

Publisher_Name, Pub_Year)

BOOK_AUTHORS(Book_id, Author_Name)

PUBLISHER(Name, Address, Phone)

BOOK_COPIES(Book_id, Branch_id, No-
of_Copies)

BOOK_LENDING(Book_id, Branch_id, Card_No, Date_Out,

Due_Date) LIBRARY_BRANCH(Branch_id, Branch_Name, Address)

Write SQL queries to

1. Retrieve details of all books in the library – id, title, name of publisher, authors, number of copies in each branch, etc.
 2. Get the particulars of borrowers who have borrowed more than 3 books, but from Jan 2017 to Jun 2017.
 3. Delete a book in BOOK table. Update the contents of other tables to reflect this data manipulation operation.
 4. Partition the BOOK table based on year of publication. Demonstrate its working with a simple query.
 5. Create a view of all books and its number of copies that are currently available in the Library.
2. Consider the following schema for Order Database:
SALESMAN(Salesman_id, Name, City, Commission)
CUSTOMER(Customer_id, Cust_Name, City, Grade,
Salesman_id) ORDERS(Ord_No, Purchase_Amt, Ord_Date,
Customer_id, Salesman_id) Write SQL queries to
 1. Count the customers with grades above Bangalore's average.
 2. Find the name and numbers of all salesmen who had more than one customer.
 3. List the entire salesman and indicate those who have and don't have customers in their cities (Use UNION operation.)
 4. Create a view that finds the salesman who has the customer with the highest order of a day. (a)

5. Demonstrate the DELETE operation by removing salesman with id 1000. All his orders must also be deleted.

3. Consider the schema for Movie Database:

ACTOR(Act_id, Act_Name, Act_Gender)

DIRECTOR(Dir_id, Dir_Name, Dir_Phone)

MOVIES(Mov_id, Mov_Title, Mov_Year, Mov_Lang, Dir_id)

MOVIE_CAST(Act_id, Mov_id, Role)

RATING(Mov_id, Rev_Stars)

Write SQL queries to

1. List the titles of all movies directed by 'Hitchcock'.
2. Find the movie names where one or more actors acted in two or more movies.
3. List all actors who acted in a movie before 2000 and also in a movie after 2015 (use JOIN operation).
4. Find the title of movies and number of stars for each movie that has at least one rating and find the highest number of stars that movie received. Sort the result by movie title.
5. Update rating of all movies directed by 'Steven Spielberg' to 5.

4. Consider the schema for College Database:

STUDENT(USN, SName, Address, Phone, Gender)

SEMSEC(SSID, Sem, Sec)

CLASS(USN, SSID)

SUBJECT(Subcode, Title, Sem, Credits)

IAMARKS(USN, Subcode, SSID, Test1, Test2, Test3, FinalIA)

Write SQL queries to

1. List all the student details studying in fourth semester 'C' section.
2. Compute the total number of male and female students in each semester and in each section.
3. Create a view of Test1 marks of student USN '1BI15CS101' in all subjects.
4. Calculate the FinalIA (average of best two test marks) and update the corresponding table for all students.
5. Categorize students based on the following criterion:
If FinalIA = 17 to 20 then CAT = 'Outstanding'
If FinalIA = 12 to 16 then CAT = 'Average'

If FinalIA < 12 then CAT = 'Weak'

Give these details only for 8th semester A, B, and C section students.

5. Consider the schema for Company Database:

EMPLOYEE(SSN, Name, Address, Sex, Salary, SuperSSN, DNo)

DEPARTMENT(DNo, DName, MgrSSN, MgrStartDate)

DLOCATION(DNo, DLoc)

PROJECT(PNo, PName, PLocation,

DNo) WORKS_ON(SSN, PNo,

Hours)

Write SQL queries to

1. Make a list of all project numbers for projects that involve an employee whose last name is 'Scott', either as a worker or as a manager of the department that controls the project.
2. Show the resulting salaries if every employee working on the 'IoT' project is given a 10 percent raise.
3. Find the sum of the salaries of all employees of the 'Accounts' department, as well as the maximum salary, the minimum salary, and the average salary in this department
4. Retrieve the name of each employee who works on all the projects controlled by department number 5 (use NOT EXISTS operator).
5. For each department that has more than five employees, retrieve the department number and the number of its employees who are making more than Rs. 6,00,000.

PART -B

Mini-Project

- For any problem selected, write the ER Diagram, apply ER-mapping rules, normalize the relations, and follow the application development process.
- Make sure that the application should have five or more tables, at least one trigger and one stored procedure, using suitable frontend tool.
- Indicative areas include; health care, education, industry, transport, supply chain, etc.

CHAPTER – 1

BASIC CONCEPTS OF SQL

Introduction to SQL

SQL stands for “Structured Query Language” and can be pronounced as “SQL” or “sequel – (Structured English Query Language)”. It is a query language used for accessing and modifying information in the database. IBM first developed SQL in 1970s. Also it is an ANSI/ISO standard. It has become a Standard Universal Language used by most of the relational database management systems (RDBMS). Some of the RDBMS systems are: Oracle, Microsoft SQL server, Sybase etc. Most of these have provided their own implementation thus enhancing its feature and making it a powerful tool. Few of the SQL commands used in SQL programming are SELECT Statement, UPDATE Statement, INSERT INTO Statement, DELETE Statement, WHERE Clause, ORDER BY Clause, GROUP BY Clause, ORDER Clause, Joins, Views, GROUP Functions, Indexes etc.

SQL Commands

SQL commands are instructions used to communicate with the database to perform specific task that work with data. SQL commands can be used not only for searching the database but also to perform various other functions like, for example, you can create tables, add data to tables, or modify data, drop the table, set permissions for users. SQL commands are grouped into four major categories depending on their functionality:

- **Data Definition Language (DDL)** - These SQL commands are used for creating, modifying, and dropping the structure of database objects. The commands are CREATE, ALTER, DROP, RENAME, and TRUNCATE.
 - **Data Manipulation Language (DML)** - These SQL commands are used for storing, retrieving, modifying and deleting data. These commands are SELECT, INSERT, UPDATE, and DELETE.
 - **Transaction Control Language (TCL)** - These SQL commands are used for managing changes affecting the data. These commands are COMMIT, ROLLBACK, and SAVEPOINT.
-

- **Data Control Language (DCL)** - These SQL commands are used for providing security to database objects. These commands are GRANT and REVOKE.

Data Definition Language (DDL)

CREATE TABLE Statement

The CREATE TABLE Statement is used to create tables to store data. Integrity Constraints like primary key, unique key and foreign key can be defined for the columns while creating the table. The integrity constraints can be defined at column level or table level. The implementation and the syntax of the CREATE Statements differs for different RDBMS.

The Syntax for the CREATE TABLE Statement is:

```
CREATE TABLE table_name
(
  column_name1 datatype constraint,
  column_name2 datatype, ...
  column_nameNdatatype);
```

- **table_name** - is the name of the table.
- **column_name1, column_name2....** - is the name of the columns
- **datatype** - is the datatype for the column like char, date, number etc.

SQL Data Types:

char(size)	Fixed-length character string. Size is specified in parenthesis. Max 255 bytes.
Varchar2(size)	Variable-length character string. Max size is specified in parenthesis.
number(size) or int	Number value with a max number of column digits specified in parenthesis.
Date	Date value in 'dd-mon-yy'. Eg., '07-jul-2004'
number(size,d) or real	Number value with a maximum number of digits of "size" total, with a maximum number of "d" digits to the right of the decimal.

SQL Integrity Constraints:

Integrity Constraints are used to apply business rules for the database tables. The constraints available in SQL are **Foreign Key, Primary key, Not Null, Unique, Check**.

Constraints can be defined in two ways:

1. The constraints can be specified immediately after the column definition. This is called column-level definition.
2. The constraints can be specified after all the columns are defined. This is called table-level definition.

1) Primary key:

This constraint defines a column or combination of columns which uniquely identifies each row in the table.

Syntax to define a Primary key at column level:

```
Column_namdatatype [CONSTRAINT constraint_name] PRIMARY KEY
```

Syntax to define a Primary key at table level:

```
[CONSTRAINT constraint_name] PRIMARY KEY (column_name1,  
column_name2, ..)
```

- **column_name1, column_name2** are the names of the columns which define the primary key.
- The syntax within the bracket i.e. [CONSTRAINT constraint_name] is optional.

2) Foreign key or Referential Integrity:

This constraint identifies any column referencing the PRIMARY KEY in another table. It establishes a relationship between two columns in the same table or between different tables. For a column to be defined as a Foreign Key, it should be defined as a Primary Key in the table which it is referring. One or more columns can be defined as Foreign key.

Syntax to define a Foreign key at column level:

```
[CONSTRAINT constraint_name] REFERENCES
```

```
referenced_table_name(column_name)
```

Syntax to define a Foreign key at table level:

```
[CONSTRAINT constraint_name] FOREIGN KEY(column_name) REFERENCES
```

```
referenced_table_name(column_name);
```

3) Not Null Constraint:

This constraint ensures all rows in the table contain a definite value for the column which is specified as not null. Which means a null value is not allowed.

Syntax to define a Not Null constraint:

```
[CONSTRAINT constraint_name] NOT NULL
```

4) Unique Key:

This constraint ensures that a column or a group of columns in each row have a distinct value. A column(s) can have a null value but the values cannot be duplicated.

Syntax to define a Unique key at column level:

```
[CONSTRAINT constraint_name] UNIQUE
```

Syntax to define a Unique key at table level:

```
[CONSTRAINT constraint_name] UNIQUE(column_name)
```

5) Check Constraint:

This constraint defines a business rule on a column. All the rows must satisfy this rule. The constraint can be applied for a single column or a group of columns.

Syntax to define a Check constraint:

```
[CONSTRAINT constraint_name] CHECK (condition)
```

ALTER TABLE Statement

The SQL ALTER TABLE command is used to modify the definition structure) of a table by modifying the definition of its columns. The ALTER command is used to perform the following functions.

- 1) Add, drop, modify table columns
- 2) Add and drop constraints
- 3) Enable and Disable constraints

Syntax to add a column

```
ALTER TABLE table_name ADD column_namedatatype;
```

For Example: To add a column "experience" to the employee table, the query would be like

```
ALTER TABLE employee ADD experience number(3);
```

Syntax to drop a column

```
ALTER TABLE table_name DROP column_name;
```

For Example: To drop the column "location" from the employee table, the query would be like

```
ALTER TABLE employee DROP location;
```

Syntax to modify a column

```
ALTER TABLE table_name MODIFY column_namedatatype;
```

For Example: To modify the column salary in the employee table, the query would be like

```
ALTER TABLE employee MODIFY salary number(15,2);
```

Syntax to add PRIMARY KEY constraint

```
ALTER TABLE table_name ADD CONSTRAINT constraint_name PRIMARY KEY  
column_name;
```

Syntax to drop PRIMARY KEY constraint

```
ALTER TABLE table_name DROP PRIMARY KEY;
```

The DROP TABLE Statement

The DROP TABLE statement is used to delete a table.

```
DROP TABLE table_name;
```

TRUNCATE TABLE Statement

What if we only want to delete the data inside the table, and not the table itself?

Then, use the TRUNCATE TABLE statement:

```
TRUNCATE TABLE table_name;
```

Data Manipulation Language (DML):**The SELECT Statement**

The SELECT statement is used to select data from a database. The result is stored in a result table, called the result-set.

SELECT Syntax:

```
SELECT * FROM table_name;
```

The SELECT DISTINCT Statement

In a table, some of the columns may contain duplicate values. This is not a problem, however, sometimes you will want to list only the different (distinct) values in a table. The DISTINCT keyword can be used to return only distinct (different) values.

SELECT DISTINCT Syntax:

```
SELECT DISTINCT column_name(s)
```

```
FROM table_name;
```

The WHERE Clause

The WHERE clause is used to extract only those records that fulfill a specified criterion.

WHERE Syntax:

```
SELECT column_name(s)
```

```
FROM table_name
```

```
WHERE column_name operator value;
```

The AND & OR Operators

- The AND operator displays a record if both the first condition and the second condition is true.
- The OR operator displays a record if either the first condition or the second condition is true.

The ORDER BY Clause

- The ORDER BY clause is used to sort the result-set by a specified column.
- The ORDER BY clausesort the records in ascending order by default.
- If you want to sort the records in a descending order, you can use the DESC keyword.

ORDER BY Syntax:

```
SELECT column_name(s)
FROM table_name
ORDER BY column_name(s) ASC|DESC;
```

The GROUP BY Clause

The GROUP BY clause can be used to create groups of rows in a table. Group functions can be applied on such groups.

GROUP BY Syntax;

```
SELECT column_name(s)
FROM table_name
WHERE column_name operator value
GROUP BY column_name(s);
```

Group functions	Meaning
AVG([DISTINCT ALL],N)	Returns average value of n
COUNT(* [DISTINCT ALL]expr)	Returns the number of rows in the query. When you specify expr, this function considers rows where expr is not null. When you specify the asterisk (*), this function Returns all rows, including duplicates and nulls. You can count either all rows, or only distinct

	values of expr.
MAX([DISTINCT ALL]expr)	Returns maximum value of expr
MIN([DISTINCT ALL]expr)	Returns minimum value of expr
SUM([DISTINCT ALL]n)	Returns sum of values of n

The HAVING clause

The HAVING clause can be used to restrict the display of grouped rows. The result of the grouped query is passed on to the HAVING clause for output filtration.

HAVING Syntax;

```
SELECT column_name(s)
FROM table_name
WHERE column_name operator value
GROUP BY column_name(s)
HAVING condition;
```

The INSERT INTO Statement

The INSERT INTO statement is used to insert a new row in a table.

SQL INSERT INTO Syntax:

It is possible to write the INSERT INTO statement in two forms.

- The first form doesn't specify the column names where the data will be inserted, only their values:

```
INSERT INTO table_name VALUES (value1, value2, value3,...);
```

OR

```
INSERT INTO table_name VALUES(&column1, &column2, &column3,...);
```

- The second form specifies both the column names and the values to be inserted:

```
INSERT INTO table_name (column1, column2, column3,...)
VALUES (value1, value2, value3,...);
```

The UPDATE Statement

The UPDATE statement is used to update existing records in a table.

SQL UPDATE Syntax:

```
UPDATE table_name  
SET column1=value, column2=value2,...  
WHERE some_column=some_value;
```

The DELETE Statement

The DELETE statement is used to delete rows in a table.

SQL DELETE Syntax:

```
DELETE FROM table_name  
WHERE some_column=some_value;
```

Transaction Control language

Transaction Control Language (TCL) commands are used to manage transactions in database. These are used to manage the changes made by DML statements. It also allows statements to be grouped together into logical transactions

Commit command

Commit command is used to permanently save any transaction into database.

Following is Commit command's syntax,

```
commit;
```

Rollback command

This command restores the database to last committed state. It is also used with savepoint command to jump to a savepoint in a transaction.

Following is Rollback command's syntax

```
rollback to savepoint_name;
```

Savepoint command

savepoint command is used to temporarily save a transaction so that you can rollback to that point whenever necessary.

Following is savepoint command's syntax,

```
savepoint savepoint_name;
```

Data Control Language

Data Control Language(DCL) is used to control privilege in Database. To perform any operation in the database, such as for creating tables, sequences or views we need privileges. Privileges are of two types,

- **System** : creating session, table etc are all types of system privilege.
- **Object** : any command or query to work on tables comes under object privilege.

DCL defines two commands,

- **Grant** : Gives user access privileges to database.
- **Revoke** : Take back permissions from user.

To Allow a User to create Session

```
grant create session to username;
```

To Allow a User to create Table

```
grant create table to username;
```

To provide User with some Space on Tablespace to store Table

```
alter user username quota unlimited on system;
```

To Grant all privilege to a User

```
grant sysdba to username
```

To Grant permission to Create any Table

```
grant create any table to username
```

STORED PROCEDURES in SQL:

The SQL Server **Stored procedure** is used to save time to write code again and again by storing the same in database and also get the required output by passing parameters.

Syntax

Following is the basic syntax of Stored procedure creation.

```
Create procedure <procedure_Name>
```

```
As
```

```
Begin
```

```
<SQL Statement>
```

```
End
```

```
Go
```

Example

Consider the CUSTOMERS table having the following records.

ID	NAME	AGE	ADDRESS	SALARY
1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

Following command is an example which would fetch all records from the CUSTOMERS table in Testdb database.

```
CREATE PROCEDURE SelectCustomerstabledata
```

```
AS
```

```
SELECT * FROM Testdb.Customers
```

```
GO
```

The above command will produce the following output.

ID	NAME	AGE	ADDRESS	SALARY
----	------	-----	---------	--------

1	Ramesh	32	Ahmedabad	2000.00
2	Khilan	25	Delhi	1500.00
3	kaushik	23	Kota	2000.00
4	Chaitali	25	Mumbai	6500.00
5	Hardik	27	Bhopal	8500.00
6	Komal	22	MP	4500.00
7	Muffy	24	Indore	10000.00

SQL TRIGGERS

Triggers are stored programs, which are automatically executed or fired when some events occur. Triggers are, in fact, written to be executed in response to any of the following events –

- A **database manipulation (DML)** statement (DELETE, INSERT, or UPDATE)
- A **database definition (DDL)** statement (CREATE, ALTER, or DROP).
- A **database operation** (SERVERERROR, LOGON, LOGOFF, STARTUP, or SHUTDOWN).

Triggers can be defined on the table, view, schema, or database with which the event is associated.

Benefits of Triggers:

Triggers can be written for the following purposes –

- Generating some derived column values automatically
- Enforcing referential integrity
- Event logging and storing information on table access
- Auditing
- Synchronous replication of tables
- Imposing security authorizations
- Preventing invalid transactions

Creating Triggers

The syntax for creating a trigger is :

```
CREATE [OR REPLACE ] TRIGGER trigger_name  
  
{ BEFORE | AFTER | INSTEAD OF }  
  
{ INSERT [OR] | UPDATE [OR] | DELETE }  
  
[OF col_name]  
  
ON table_name  
  
[REFERENCING OLD AS o NEW AS n]  
  
[FOR EACH ROW]  
  
WHEN (condition)  
  
DECLARE  
  
    Declaration-statements  
  
BEGIN  
  
    Executable-statements  
  
EXCEPTION  
  
    Exception-handling-statements  
  
END;
```

Where,

- CREATE [OR REPLACE] TRIGGER trigger_name – Creates or replaces an existing trigger with the *trigger_name*.
 - {BEFORE | AFTER | INSTEAD OF} – This specifies when the trigger will be executed. The INSTEAD OF clause is used for creating trigger on a view.
 - {INSERT [OR] | UPDATE [OR] | DELETE} – This specifies the DML operation.
-

-
- [OF col_name] – This specifies the column name that will be updated.
 - [ON table_name] – This specifies the name of the table associated with the trigger.
 - [REFERENCING OLD AS o NEW AS n] – This allows you to refer new and old values for various DML statements, such as INSERT, UPDATE, and DELETE.
 - [FOR EACH ROW] – This specifies a row-level trigger, i.e., the trigger will be executed for each row being affected. Otherwise the trigger will execute just once when the SQL statement is executed, which is called a table level trigger.
 - WHEN (condition) – This provides a condition for rows for which the trigger would fire. This clause is valid only for row-level triggers.

Example

To start with, we will be using the CUSTOMERS table we had created and used in the previous chapters –

```
Select * from customers;
```

```
+__+_____+__+_____+_____+
| ID | NAME   | AGE | ADDRESS | SALARY |
+__+_____+__+_____+_____+
| 1 | Ramesh | 32 | Ahmedabad | 2000.00 |
| 2 | Khilan | 25 | Delhi    | 1500.00 |
| 3 | kaushik | 23 | Kota     | 2000.00 |
| 4 | Chaitali | 25 | Mumbai   | 6500.00 |
| 5 | Hardik | 27 | Bhopal   | 8500.00 |
| 6 | Komal | 22 | MP       | 4500.00 |
+__+_____+__+_____+_____+
```

The following program creates a **row-level** trigger for the customers table that would fire for INSERT or UPDATE or DELETE operations performed on the CUSTOMERS table. This trigger will display the salary difference between the old values and new values –

```
CREATE OR REPLACE TRIGGER display_salary_changes
BEFORE DELETE OR INSERT OR UPDATE ON customers
FOR EACH ROW
WHEN (NEW.ID > 0)
DECLARE
    sal_diff number;
BEGIN
    sal_diff := :NEW.salary - :OLD.salary;
    dbms_output.put_line('Old salary: ' || :OLD.salary);
    dbms_output.put_line('New salary: ' || :NEW.salary);
    dbms_output.put_line('Salary difference: ' || sal_diff);
END;
/
```

When the above code is executed at the SQL prompt, it produces the following result –

Trigger created.

The following points need to be considered here –

- OLD and NEW references are not available for table-level triggers, rather you can use them for record-level triggers.
 - If you want to query the table in the same trigger, then you should use the AFTER keyword, because triggers can query the table or change it again only after the initial changes are applied and the table is back in a consistent state.
 - The above trigger has been written in such a way that it will fire before any DELETE or INSERT or UPDATE operation on the table, but you can write your trigger on a
-

single or multiple operations, for example BEFORE DELETE, which will fire whenever a record will be deleted using the DELETE operation on the table.

Triggering a Trigger

Let us perform some DML operations on the CUSTOMERS table. Here is one INSERT statement, which will create a new record in the table –

```
INSERT INTO CUSTOMERS (ID,NAME,AGE,ADDRESS,SALARY)
VALUES (7, 'Kriti', 22, 'HP', 7500.00 );
```

When a record is created in the CUSTOMERS table, the above create trigger, **display_salary_changes** will be fired and it will display the following result –

```
Old salary:
New salary: 7500
Salary difference:
```

Because this is a new record, old salary is not available and the above result comes as null.

Let us now perform one more DML operation on the CUSTOMERS table. The UPDATE statement will update an existing record in the table –

```
UPDATE customers
SET salary = salary + 500
WHERE id = 2;
```

When a record is updated in the CUSTOMERS table, the above create trigger, **display_salary_changes** will be fired and it will display the following result –

```
Old salary: 1500
New salary: 2000
Salary difference: 500
```

VIEWS IN SQL

- A view is a single *virtual table* that is derived from other tables. The other tables could be base tables or previously defined view.
 - Allows for limited update operations Since the table may not physically be stored
 - Allows full query operations
 - A convenience for expressing certain operations
 - A view does not necessarily exist in physical form, which limits the possible update operations that can be applied to views.
-

CHAPTER – 2

LIBRARY DATABASE

1) Consider the following schema for a Library Database:

BOOK (Book_id, Title, Publisher_Name, Pub_Year)

BOOK_AUTHORS (Book_id, Author_Name)

PUBLISHER (Name, Address, Phone)

BOOK_COPIES (Book_id, Branch_id, No-of_Copies)

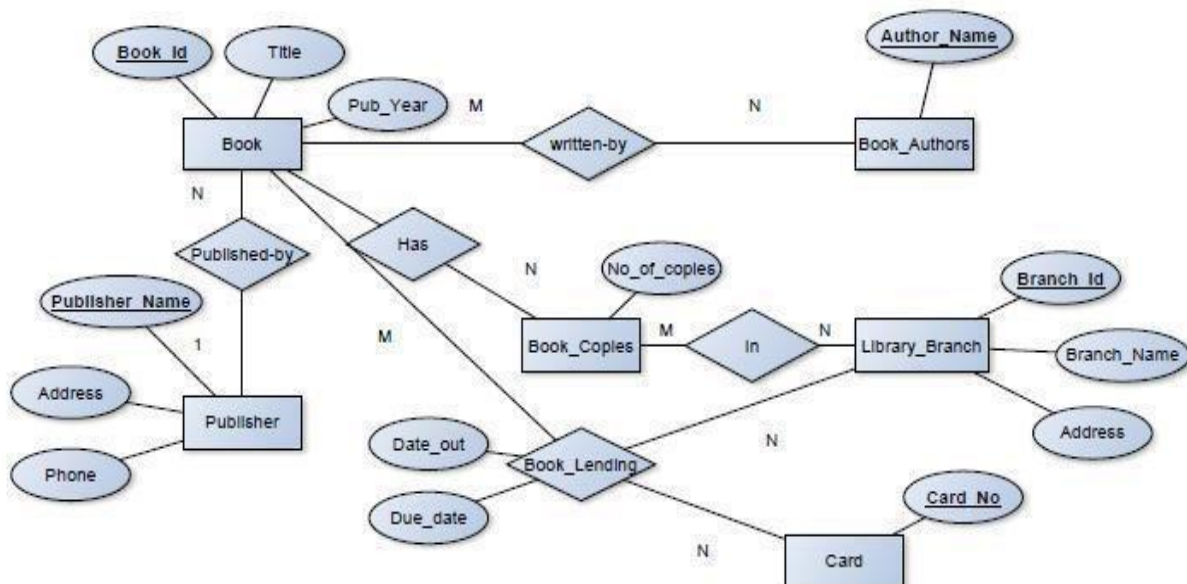

BOOK_LENDING (Book_id, Branch_id, Card_No, Date_Out, Due_Date)

LIBRARY_BRANCH (Branch_id, Branch_Name, Address)

Write SQL queries to

1. Retrieve details of all books in the library – id, title, name of publisher, authors, number of copies in each branch, etc.
2. Get the particulars of borrowers who have borrowed more than 3 books, but from Jan 2017 to Jun 2017
3. Delete a book in BOOK table. Update the contents of other tables to reflect this data manipulation operation.
4. Partition the BOOK table based on year of publication. Demonstrate its working with a simple query.
5. Create a view of all books and its number of copies that are currently available in the Library.

ER-Diagram:

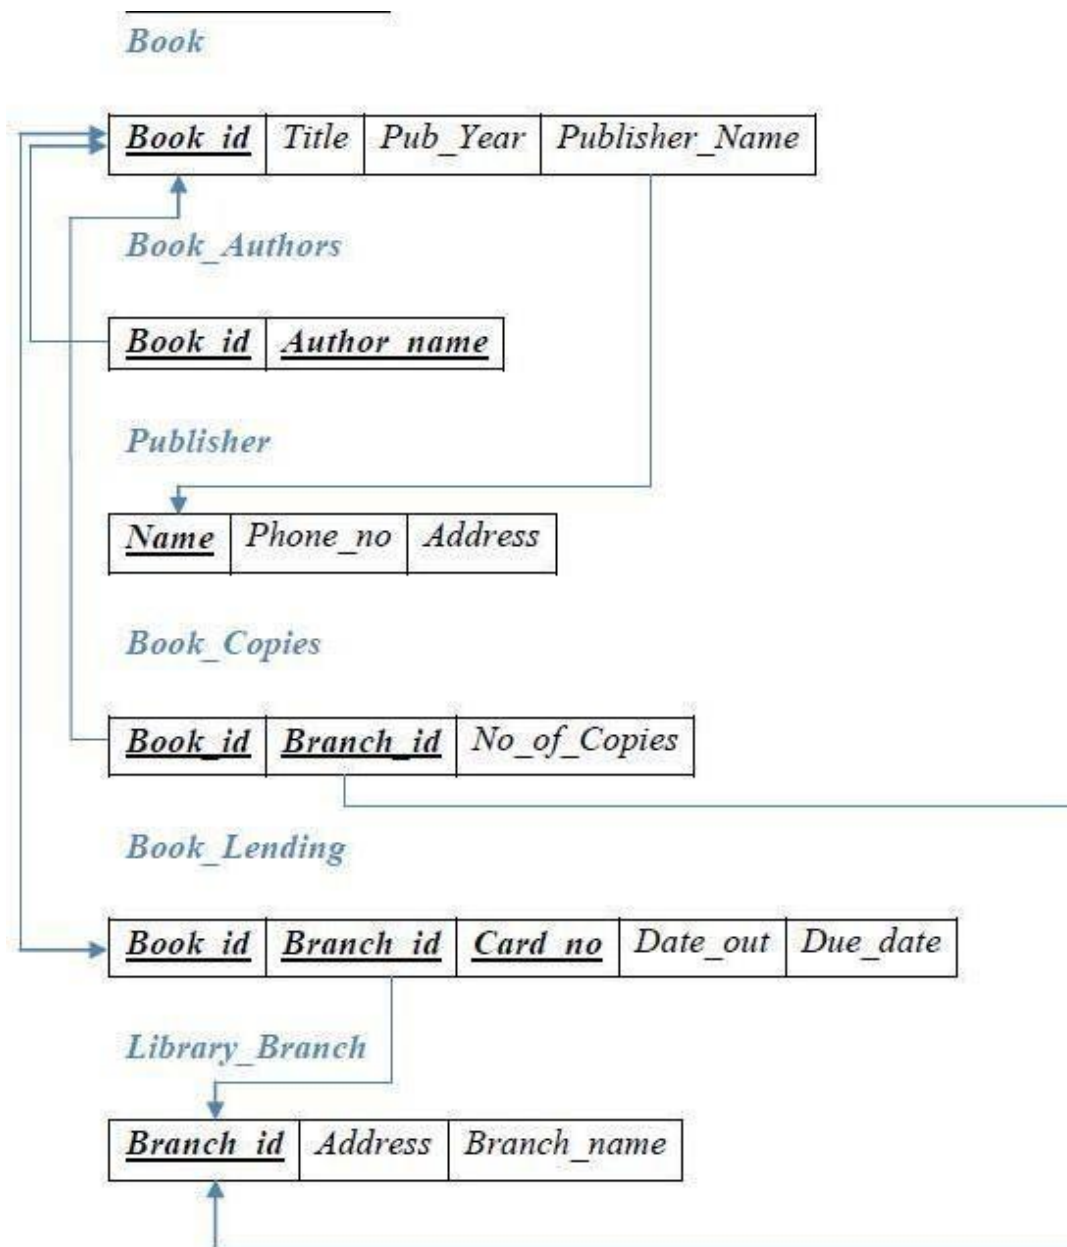

SCHEMA:

Table Creation:

PUBLISHER

```
SQL> CREATE TABLE PUBLISHER(  
    NAME VARCHAR(18) PRIMARY KEY,  
    ADDRESS VARCHAR(10),  
    PHONE VARCHAR(10));
```

Table created.

BOOK

```
SQL> CREATE TABLE BOOK(  
    BOOK_ID INTEGER PRIMARY KEY,  
    TITLE VARCHAR(20),  
    PUBLISHER-NAME VARCHAR(20), FOREIGN KEY(PUBLISHER-NAME) REFERENCES  
    PUBLISHER(NAME) ON DELETE CASCADE,  
    PUB_YEAR NUMBER(4));
```

Table created.

BOOK_AUTHORS

```
SQL> CREATE TABLE BOOK_AUTHORS(  
    BOOK_ID INTEGER, FOREIGN KEY(BOOK_ID) REFERENCES  
    BOOK(BOOK_ID) ON DELETE CASCADE, AUTHOR_NAME VARCHAR(20),  
    PRIMARY KEY(BOOK_ID));
```

Table created.

LIBRARY_BRANCH

```
SQL> CREATE TABLE LIBRARY_BRANCH(  
    BRANCH_ID INTEGER PRIMARY KEY,  
    BRANCH_NAME VARCHAR(18),  
    ADDRESS VARCHAR(15));
```

Table created.

BOOK_COPIES

```
SQL> CREATE TABLE BOOK_COPIES(  
    BOOK_ID INTEGER, FOREIGN KEY(BOOK_ID) REFERENCES BOOK_ID  
    BOOK(BOOK_ID) ON DELETE CASCADE, BRANCH_ID INTEGER, FOREIGN  
    KEY(BRANCH_ID) REFERENCES LIBRARY_BRANCH(BRANCH_ID) ON DELETE  
    CASCADE,  
    NO_OF_COPIES INTEGER,  
    PRIMARY KEY(BOOK_ID, BRANCH_ID));
```

Table created.

BOOK_LENDING

```
SQL> CREATE TABLE BOOK_LENDING (  
    BOOK_ID INTEGER, FOREIGN KEY (BOOK_ID) REFERENCES BOOK (BOOK_ID) ON  
    DELETE CASCADE, BRANCH_ID INTEGER, FOREIGN KEY (BRANCH_ID)  
    REFERENCES LIBRARY_BRANCH (BRANCH_ID) ON DELETE  
                                CASCADE,  
    CARD_NO INTEGER,  
    DATE_OUT DATE,  
    DUE_DATE DATE,  
    PRIMARY KEY (BOOK_ID, BRANCH_ID, CARD_NO));
```

Table created.

Values for tables:

PUBLISHER

```
SQL> INSERT INTO PUBLISHER VALUES ('PEARSON', 'BANGALORE', '9875462530');  
SQL> INSERT INTO PUBLISHER VALUES ('MCGRAW', 'NEWDELHI', '7845691234');  
SQL> INSERT INTO PUBLISHER VALUES ('SAPNA', 'BANGALORE', '7845963210');
```

BOOK

```
SQL> INSERT INTO BOOK VALUES (1111, 'SE', 'PEARSON', 2005);  
SQL> INSERT INTO BOOK VALUES (2222, 'DBMS', 'MCGRAW', 2004);  
SQL> INSERT INTO BOOK VALUES (3333, 'ANOTOMY', 'PEARSON', 2010);  
SQL> INSERT INTO BOOK VALUES (4444, 'ENCYCLOPEDIA', 'SAPNA', 2010);
```

BOOK_AUTHORS

```
SQL> INSERT INTO BOOK_AUTHORS VALUES (1111, 'SOMMERVILLE');  
SQL> INSERT INTO BOOK_AUTHORS VALUES (2222, 'NAVATHE');  
SQL> INSERT INTO BOOK_AUTHORS VALUES (3333, 'HENRY GRAY');  
SQL> INSERT INTO BOOK_AUTHORS VALUES (4444, 'THOMAS');
```

LIBRARY_BRANCH

```
SQL> INSERT INTO LIBRARY_BRANCH VALUES(11,'CENTRAL TECHNICAL','MG ROAD');
SQL> INSERT INTO LIBRARY_BRANCH VALUES(22,'MEDICAL','BH ROAD');
SQL> INSERT INTO LIBRARY_BRANCH VALUES(33,'CHILDREN','SS PURAM');
SQL> INSERT INTO LIBRARY_BRANCH VALUES(44,'SECRETARIAT','SIRAGATE');
SQL> INSERT INTO LIBRARY_BRANCH VALUES(55,'GENERAL','JAYANAGAR');
```

BOOK_COPIES

```
SQL> INSERT INTO BOOK_COPIES VALUES(1111,11,5);
SQL> INSERT INTO BOOK_COPIES VALUES(3333,22,6);
SQL> INSERT INTO BOOK_COPIES VALUES(4444,33,10);
SQL> INSERT INTO BOOK_COPIES VALUES(2222,11,12);
SQL> INSERT INTO BOOK_COPIES VALUES(4444,55,3);
```

BOOK_LENDING

```
SQL> INSERT INTO BOOK_LENDING VALUES(2222,11,1,'10-JAN-2017','20-AUG-2017');
SQL> INSERT INTO BOOK_LENDING VALUES(3333,22,2,'09-JUL-2017','12-AUG-2017');
SQL> INSERT INTO BOOK_LENDING VALUES(4444,55,1,'11-APR-2017','09-AUG-2017');
SQL> INSERT INTO BOOK_LENDING VALUES(2222,11,5,'09-AUG-2017','19-AUG-2017');
SQL> INSERT INTO BOOK_LENDING VALUES(4444,33,1,'10-JUN-2017','15-AUG-2017');
SQL> INSERT INTO BOOK_LENDING VALUES(1111,11,1,'12-MAY-2017','10-JUN-2017');

CHAPTER – 3

ORDER DATABASE

2) Consider the following schema for Order Database:

SALESMAN (Salesman_id, Name, City, Commission)

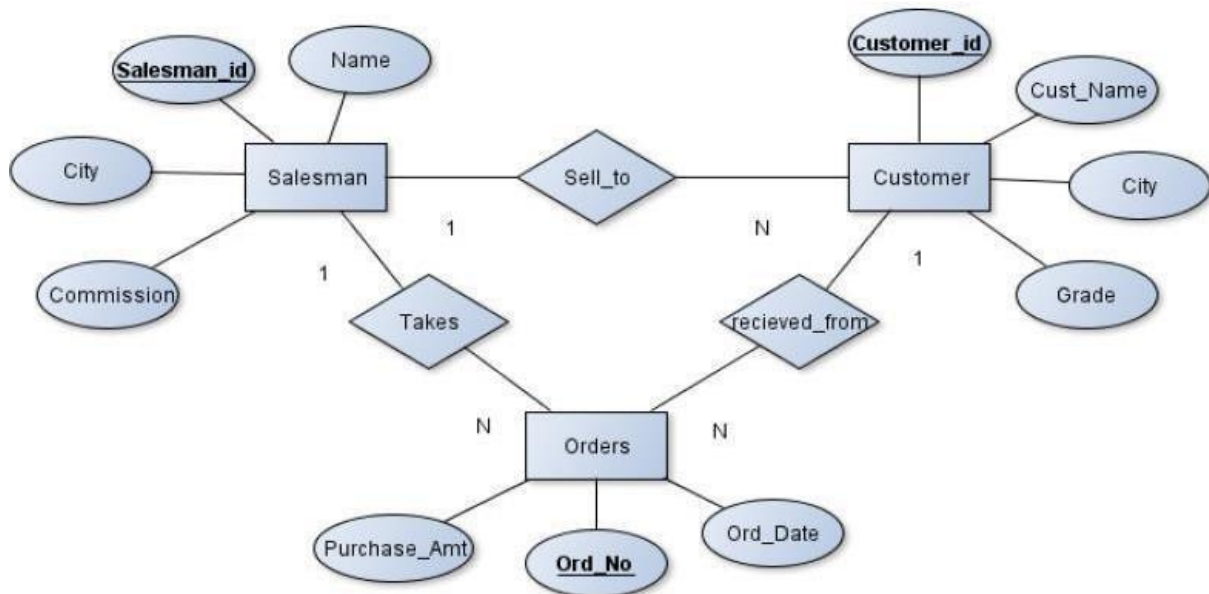

CUSTOMER (Customer_id, Cust_Name, City, Grade, Salesman_id)

ORDERS (Ord_No, Purchase_Amt, Ord_Date, Customer_id, Salesman_id)

Write SQL queries to

1. Count the customers with grades above Bangalore's average.
2. Find the name and numbers of all salesmen who had more than one customer.
3. List all salesmen and indicate those who have and don't have customers in their cities (Use UNION operation.)
4. Create a view that finds the salesman who has the customer with the highest order of a day.
5. Demonstrate the DELETE operation by removing salesman with id 1000. All his orders must also be deleted.

ER-Diagram:

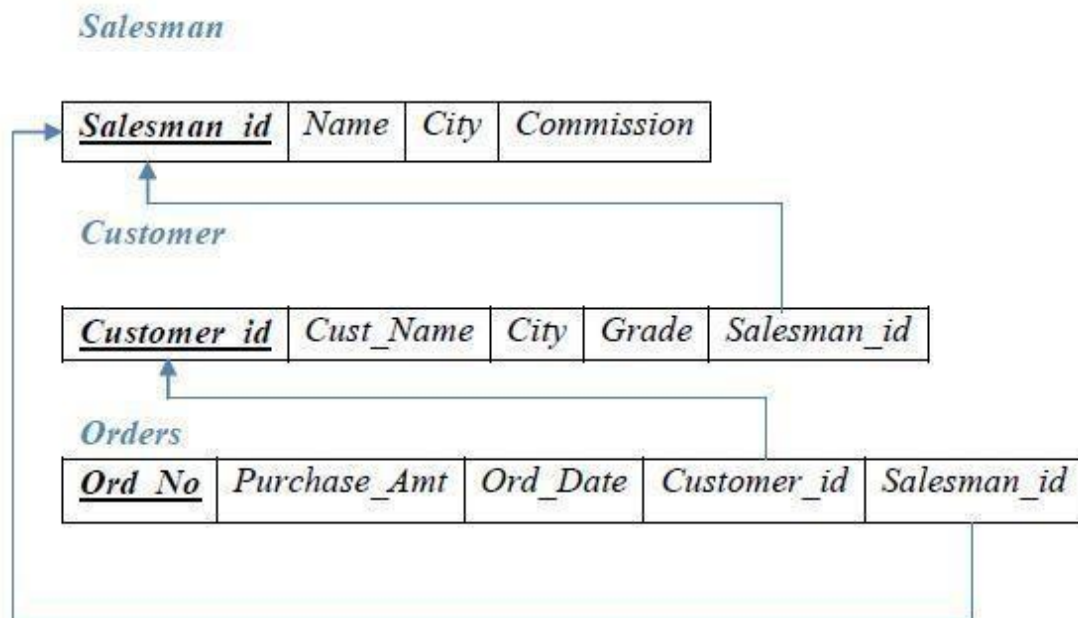

SCHEMA:

Table Creation:

SALESMAN

```
CREATE TABLE SALESMAN(  
SALESMAN_ID NUMBER(5) CONSTRAINT SALESMAN_SALID PRIMARY KEY,  
NAME VARCHAR(10) CONSTRAINT SALESMAN_NAME_NN NOT NULL,  
CITY VARCHAR(15) CONSTRAINT SALESMAN_CITY_NN NOT NULL,  
COMMISSION NUMBER(5));
```

Table created.

CUSTOMER

```
CREATE TABLE CUSTOMER(  
CUSTOMER_ID NUMBER(5) CONSTRAINT CUSTOMER_CUSTID_PK PRIMARY KEY,  
CUST_NAME VARCHAR(10) CONSTRAINT CUSTOMER_CUSTNAME_NN NOT NULL,  
CITY VARCHAR(10) CONSTRAINT CUSTOMER_CITY_NN NOT NULL,  
GRADE NUMBER(5) CONSTRAINT CUSTOMER_GRADE_NN NOT NULL,  
SALESMAN_ID NUMBER(5) CONSTRAINT CUSTOMER_SALEID_FK REFERENCES  
SALESMAN(SALESMAN_ID) ON DELETE SET NULL);
```

Table created.

ORDERS

```
CREATE TABLE ORDERS(  
ORD_NO NUMBER(5) CONSTRAINT ORDERS_ODNO_PK PRIMARY KEY,  
PURCHASE_AMT INTEGER CONSTRAINT ORDERS_PAMT_NN NOT NULL,  
ORD_DATE DATE CONSTRAINT ORDERS_ODATE_NN NOT NULL,  
CUSTOMER_ID NUMBER(5) CONSTRAINT ORDERS_CUSTID_FK REFERENCES  
CUSTOMER(CUSTOMER_ID),  
SALESMAN_ID NUMBER(5) CONSTRAINT ORDERS_SALEID_FK REFERENCES  
SALESMAN(SALESMAN_ID) ON DELETE CASCADE);
```

Table created.

Values for tables

```
SQL> INSERT INTO SALESMAN VALUES (&SALESMAN_ID, '&NAME', '&CITY', &COMMISSION);
```

```
SQL> INSERT INTO CUSTOMER  
VALUES (&CUSTOMER_ID, '&CUST_NAME', '&CITY', '&GRADE', &SALESMAN_ID);
```

```
SQL> INSERT INTO ORDERS  
VALUES (&ORD_NO, &PURCHASE_AMT, '&ORD_DATE', &CUSTOMER_ID, &SALESMAN_ID);
```

```
SELECT * FROM SALESMAN;
```

SALESMAN_ID	NAME	CITY	COMMISSION
1000	RAJ	BENGALURU	50
2000	ASHWIN	TUMKUR	30
3000	BINDU	MUMBAI	40
4000	LAVANYA	BENGALURU	40
5000	ROHIT	MYSORE	60

```

22	TCS	BENGALURU	4	2000
33	WIPRO	MYSORE	7	1000
44	TCS	MYSORE	6	2000
55	ORACLE	TUMKUR	3	3000

```
SELECT * FROM ORDERS;
```

ORD_NO	PURCHASE_AMT	ORD_DATE	CUSTOMER_ID	SALESMAN_ID
1	200000	12-APR-16	11	1000
2	300000	12-APR-16	11	2000
3	400000	15-APR-17	22	1000

- Count the customers with grades above Bangalore's average.

```
SELECT COUNT(CUSTOMER_ID)
FROM CUSTOMER
WHERE GRADE > (SELECT AVG(GRADE)
               FROM CUSTOMER
               WHERE CITY LIKE '%BENGALURU');
```

```
COUNT(CUSTOMER_ID)
-----
3
```

2. Find the name and numbers of all salesmen who had more than one customer.

```
SELECT NAME, COUNT(CUSTOMER_ID)
FROM SALESMAN S, CUSTOMER C
WHERE S.SALESMAN_ID=C.SALESMAN_ID
GROUP BY NAME
HAVING COUNT(CUSTOMER_ID)>1;
```

NAME	COUNT(CUSTOMER_ID)
ASHWIN	2
RAJ	2

3. List all salesmen and indicate those who have and don't have customers in their cities (Use UNION operation.)

```
(SELECT NAME
FROM SALESMAN S, CUSTOMER C
WHERE S.SALESMAN_ID=C.SALESMAN_ID AND
      S.CITY=C.CITY)
UNION
(SELECT NAME
FROM SALESMAN
WHERE SALESMAN_ID NOT IN(SELECT S1.SALESMAN_ID
                           FROM SALESMAN S1, CUSTOMER C1
                           WHERE S1.SALESMAN_ID=C1.SALESMAN_ID AND
                              S1.CITY=C1.CITY));
```

NAME
ASHWIN
BINDU
LAVANYA
RAJ
ROHIT

4. Create a view that finds the salesman who has the customer with the highest order of a day.

```
CREATE VIEW SALES_HIGHERODER AS
SELECT SALESMAN_ID, PURCHASE_AMT
FROM ORDERS
WHERE PURCHASE_AMT=(SELECT MAX(O.PURCHASE_AMT)
                    FROM ORDERS O
                    WHERE O.ORD_DATE='12-APR-16');
```

View created.

```
SELECT * FROM SALES_HIGHERODER;
```

SALESMAN_ID	PURCHASE_AMT
2000	300000

5. Demonstrate the DELETE operation by removing salesman with id 1000. All his orders must also be deleted.

```
DELETE from salesman
WHERE salesman_id = 1000;
```

1 row deleted.

```
SELECT * FROM SALESMAN;
```

SALESMAN_ID	NAME	CITY	COMMISSION
2000	ASHWIN	TUMKUR	30

CHAPTER – 4

MOVIE DATABASE

3) Consider the schema for Movie Database:

ACTOR (Act_id, Act_Name, Act_Gender)

DIRECTOR (Dir_id, Dir_Name, Dir_Phone)

MOVIES (Mov_id, Mov_Title, Mov_Year, Mov_Lang, Dir_id)

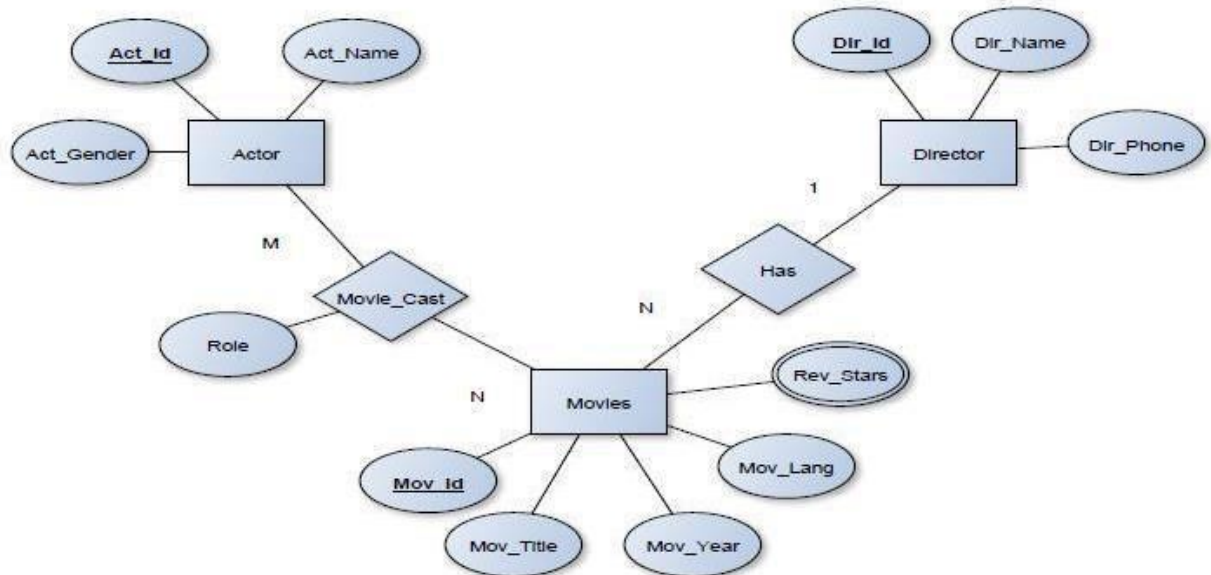

MOVIE_CAST (Act_id, Mov_id, Role)

RATING (Mov_id, Rev_Stars)

Write SQL queries to

1. List the titles of all movies directed by 'Hitchcock'.
2. Find the movie names where one or more actors acted in two or more movies.
3. List all actors who acted in a movie before 2000 and also in a movie after 2015 (use JOIN operation).
4. Find the title of movies and number of stars for each movie that has at least one rating and find the highest number of stars that movie received. Sort the result by movie title.
5. Update rating of all movies directed by 'Steven Spielberg' to 5.

ER-Diagram:

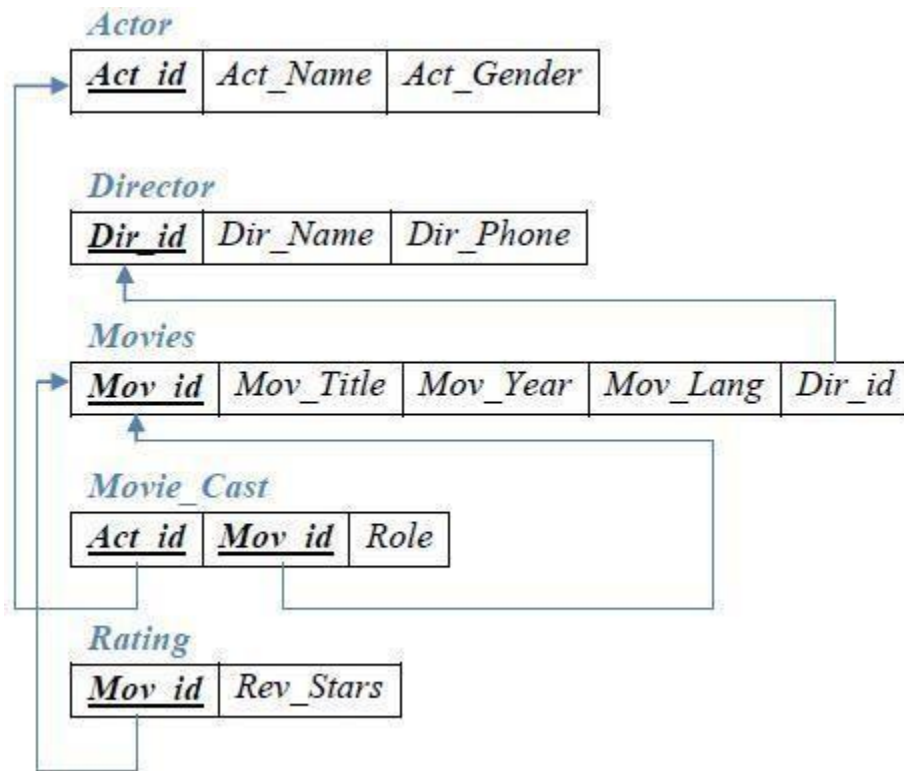

SCHEMA:

Table Creation:

ACTOR

```
CREATE TABLE ACTOR(  
ACT_ID NUMBER(5) CONSTRAINT ACTOR_ACTID_PK PRIMARY KEY,

CHAPTER - 5

COLLEGE DATABASE

4). Consider the schema for College Database:

STUDENT (USN, SName, Address, Phone, Gender)

SEMSEC (SSID, Sem, Sec)

CLASS (USN, SSID)

SUBJECT (Subcode, Title, Sem, Credits)

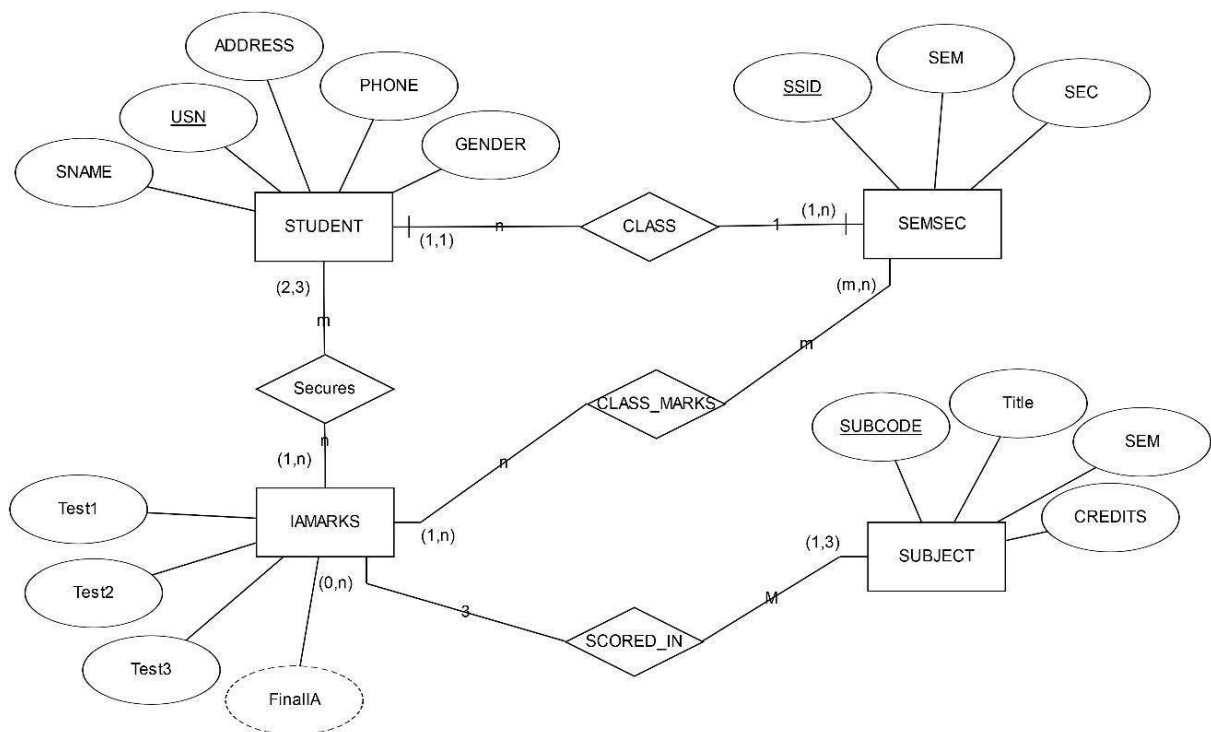

IAMARKS (USN, Subcode, SSID, Test1, Test2, Test3, FinalIA)

Write SQL queries to

1. List all the student details studying in fourth semester 'C' section.
2. Compute the total number of male and female students in each semester and in each section.
3. Create a view of Test1 marks of student USN '1BI15CS101' in all subjects.
4. Calculate the FinalIA (average of best two test marks) and update the corresponding table for all students.
5. Categorize students based on the following criterion:
 If FinalIA = 17 to 20 then CAT = 'Outstanding'
 If FinalIA = 12 to 16 then CAT = 'Average'
 If FinalIA < 12 then CAT = 'Weak'

Give these details only for 8th semester A, B, and C section students.

ER-Diagram:

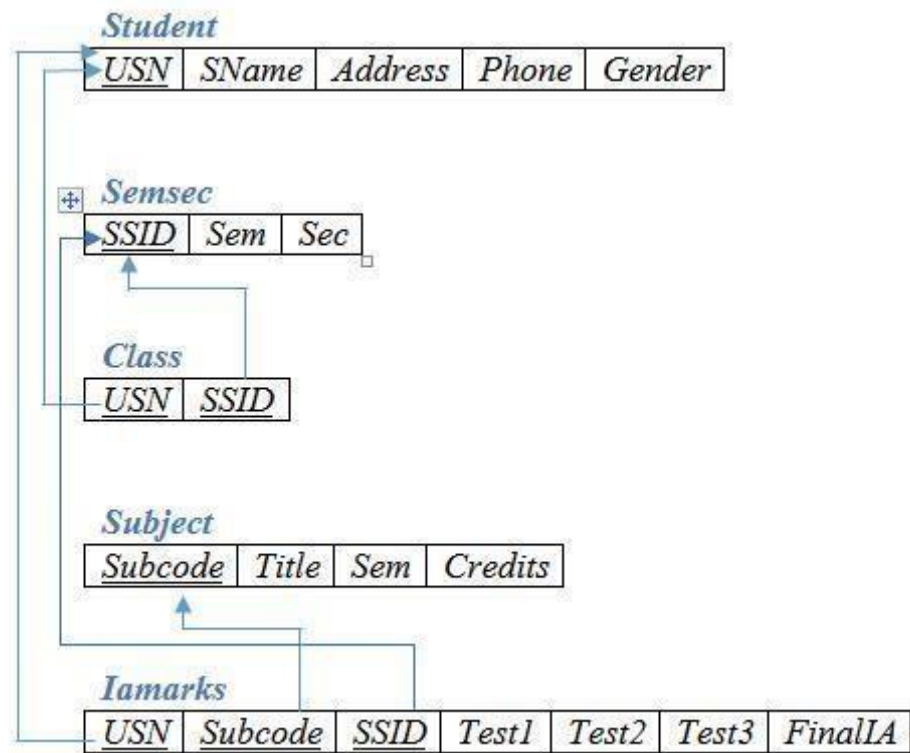

SCHEMA:

Table Creation:

COMPANY DATABASE

5). Consider the schema for Company Database:

EMPLOYEE (SSN, Name, Address, Sex, Salary, SuperSSN,DNo)

DEPARTMENT (DNo, DName, MgrSSN, MgrStartDate)

DLOCATION (DNo,DLoc)

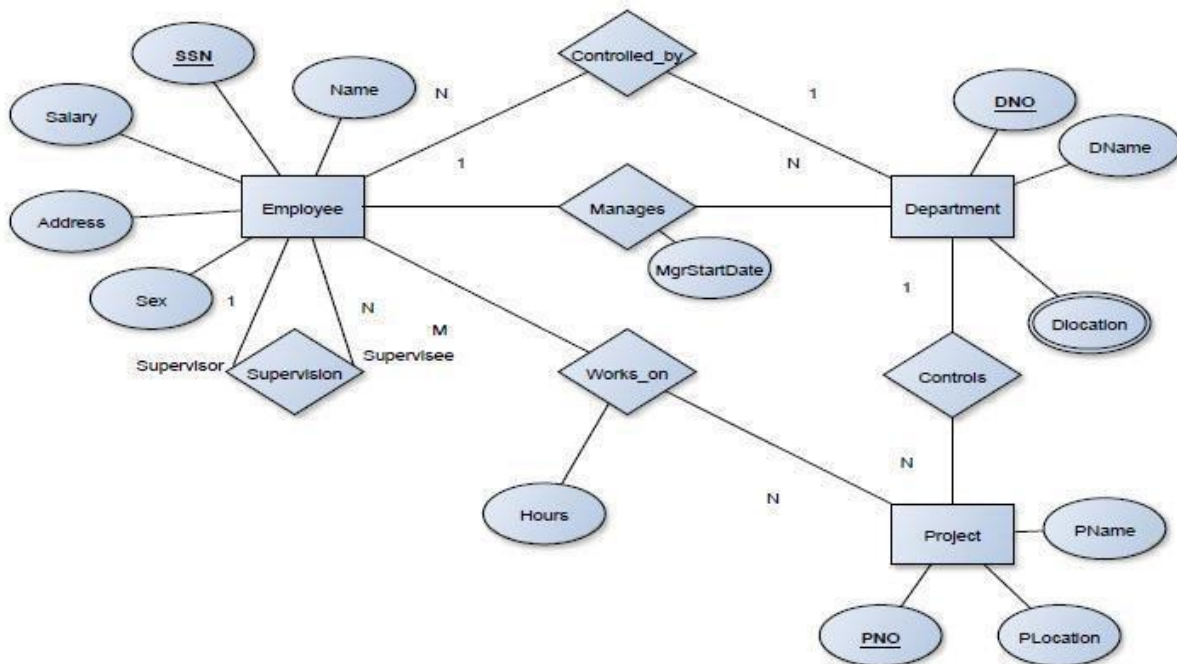

PROJECT (PNo, PName, PLocation,

DNo) WORKS_ON (SSN, PNo, Hours)

Write SQL queries to

1. Make a list of all project numbers for projects that involve an employee whose last name is 'Scott', either as a worker or as a manager of the department that controls the project.
2. Show the resulting salaries if every employee working on the 'IoT' project is given a 10 percent raise.
3. Find the sum of the salaries of all employees of the 'Accounts' department, as well as the maximum salary, the minimum salary, and the average salary in this department
4. Retrieve the name of each employee who works on all the projects controlled by department number 5 (use NOT EXISTS operator).
5. For each department that has more than five employees, retrieve the department number and the number of its employees who are making more than Rs. 6,00,000.

ER-Diagram:

VIVA QUESTIONS

1. Define Data.
 2. Define Information.
 3. Define Database.
 4. Define DBMS.
 5. What do you mean by processed data?
 6. What do you mean by data management?
 7. Which are the actions that are performed on the database?
 8. Mention the different types of DBMS.
 9. Define Data model.
 10. Mention the different types of Data models.
 11. Why database approach is advantageous than the file system approach?
 12. Who is called as the father of RDBMS?
 13. What do you mean by redundant data?
 14. What do you mean by Data duplication?
 15. Mention the different relational algebra operations.
 16. Mention the different User interfaces provided by the database system.
 17. Mention the different languages provided by the database system
 18. What is the difference between select operation in relational algebra and in SQL?
 19. What is the difference between JOIN and Cartesian product?
 20. Mention the different types of Join operations.
 21. What is the difference between EQUIJOIN and NATURAL JOIN?
 22. What is the difference between OUTER JOIN and JOIN.?
 23. What is the difference between OUTER UNION and UNION?
 24. What do you mean by Union Compatibility.?
 25. What do you mean by Type Compatibility?
 26. Mention the different types of relational constraints.
 27. Mention the different types of structural constraints
 28. What do you mean by cardinality?
 29. What do you mean by cardinality ratio?
 30. What do you mean by degree of a relation?
 31. What do you mean by entity integrity constraint?
 32. What do you mean by referential integrity constraint?
 33. What do you mean by NULL constraint?
 34. What do you mean by unique constraint?
 35. What do you mean by Check constraint?
 36. Define functional dependency.
 37. Define normalization.
 38. Define normal form
 39. Mention the different types of normal forms
 40. What is the difference between 3NF and BCNF?
 41. What do you mean by JOIN dependencies?
 42. What do you mean by Inclusion dependencies?
 43. What do you mean by Template dependencies?
 44. What do you mean by Multivalued dependencies?
 45. Define Project Join Normal form.
-

-
46. Define Domain Key Normal form.
 47. Mention the informal guidelines for database design.
 48. Define super key.
 49. Define primary key.
 50. Define foreign key.
 51. Define unique key.
 52. Define prime attribute.
 53. Define trivial functional dependency.
 54. When a FD is said to be fully FD?
 55. Mention the different Armstrong's inference rules.
 56. Why Armstrong's inference rules are said to be sound and complete?
 57. Define denormalisation.
 58. Define Transaction.
 59. Mention the ACID properties.
 60. Define schedule.
 61. Is DBMS usage always advisable or some times we may depend on file base systems? Comment on the statement by describing the situation where DBMS is not a better option & file base systems is better.
 62. Describe 3-level architecture of DBMS with details of languages associated at different levels plus the level of data independence.
 63. How logical architecture of DBMS differs from physical architecture?
 64. Create an E R diagram and relational schema to hold information about the situation in many institutions affiliated to some University, many teachers of different disciplines are teaching to many students enrolled in many courses offered by the university to the students through the institutions. Use concept of keys, aggregation, generalisation, cardinality etc. in a proper way.
 65. What is the utility of relational algebra & relational calculus? Name some software's based on these concepts?
 66. Comment on the statement "Set theory has contributed a lot to RDBMS" support it with the help of suitable examples.
 67. "Redundancy of data is many times beneficial" Justify the statement, also describe the situation when redundancy will mess up the current data base status, at that instance of time what actions you will prefer to take.
 68. In Oracle we are having variety of versions Oracle 8, Oracle 9, etc, what does the associated number mean. Again we are having Oracle 8i, Oracle 9i etc, what does this "i" mean.
 69. Describe the various file organization techniques? How a binary tree is different from B-tree and B+ tree? Under which situation we need to use B+ tree or B tree. Prove "Any relation which is in BCNF is in 3NF, but converse is not true"
 70. Which functional dependencies are to be removed to achieve respective normal form? Discuss all the normal forms up to 4NF?
 71. What is the mathematical basis of SQL? The SQL statement: select * from student will perform like projection or selection? Give details in support of your answer.
